

Import Data using Transform Maps (Spreadsheet)

PROJECT PLANNING PHASE

1. Project Scope & Deliverables

- Phase 1: Source Data Preparation: Create a standardized Microsoft Excel (.xlsx) template containing sample employee records (including fields like Employee ID, Name, Email, Department, and Location).
- Phase 2: Custom Schema Development: Build the custom target table (Employee Test / u_employee_test) within the ServiceNow Global application scope.
- Phase 3: Staging & Import Set Setup: Load raw spreadsheet data into a staging import set table (u_employee_import).
- Phase 4: Transform Map Configuration: Establish field mappings between source columns and target attributes, configuring auto-mapping and mapping assist.
- Phase 5: Data Transformation & Validation: Execute initial data loads, verify transformation logs, and review successful insertions in the target table.
- Phase 6: De-duplication Logic Implementation: Enable the Coalesce feature on the Employee ID field to handle updates versus new inserts intelligently during subsequent imports.
- Phase 7: Analytics & Reporting Setup: Build three core reports (Department Pie Chart, Location Bar Chart, and Employee List Report).
- Phase 8: Dashboard Integration & Security: Configure the Employee Analytics Dashboard, adjust necessary ACL configurations (pa_dashboards), and assign proper sharing roles.

2. Timeline & Execution Roadmap

- Milestone 1: Data Structuring & Schema Setup (Phases 1–3)
 - Finalize the sample spreadsheet format.
 - Provision the custom target table and fields in ServiceNow.
 - Successfully execute the initial Load Data step into the staging table.
- Milestone 2: Mapping & Integrity Controls (Phases 4–6)
 - Map source and target fields utilizing the Mapping Assist utility.
 - Run initial transformations and confirm a clean success status.

- Activate Coalesce on Employee ID and test iterative batch uploads to manage updates and prevent duplicates.
- Milestone 3: Reporting, Visualization & Rollout (Phases 7–8)
 - Develop and validate the three individual analytics reports.
 - Resolve ACL access parameters for dashboard creation.
 - Consolidate widgets into the central dashboard and set up user sharing parameters.

3. Resource Allocation & Responsibilities

- ServiceNow Administrator / Developer: Responsible for building custom tables, configuring transform maps, managing access controls (ACLs), and setting up system dashboards.
- HR / Business Analyst: Responsible for providing clean source data spreadsheets, defining reporting requirements, and validating imported employee data integrity.
