

Import Data using Transform Maps (Spreadsheet)

PROJECT DEVELOPMENT PHASE

1. Phase 1: Source Data Preparation

- Open Google Spreadsheets and create sample employee data containing fields such as Employee ID, Name, Email, Department, and Location.
- Download the configured worksheet in Microsoft Excel (.xlsx) format under the name Sample Spreadsheet.xlsx.

2. Phase 2: Create Custom Table & Fields

- Navigate to Tables > Create New in the application navigator to establish a custom table with the label Employee Test and name u_employee_test.
- Open the table form layout and create the required columns matching string data types: Employee ID, Employee Name, Email, Department, and Location.

3. Phase 3: Staging Table & Data Loading

- Navigate to Load Data under System Import Sets in the application navigator.
- Create an import set table with the label Employee Import (u_employee_import), upload the Sample Spreadsheet.xlsx file, and submit the form to stage the raw data.

4. Phase 4: Transform Map Configuration & Execution

- Click Create Transform Map from the progress screen, naming it Sample Spreadsheet Import with Employee Import as the source and Employee Test as the target.
- Use Auto Map Matching Fields or Mapping Assist to link corresponding source and target attributes (e.g., mapping u_name to u_employee_name and u_employee_id to u_employee_id).
- Select the corresponding import set and execute the Transform process to migrate data into the target table.

5. Phase 5: Data Validation & Personalization

- Open the Employee Test table from the application navigator to review successfully created records.
- Use Personalize List Columns to arrange and verify fields like Employee ID, Name, Email, Department, and Location in the list view.

6. Phase 6: Enable Coalesce for Duplicate Prevention

- Open the Sample Spreadsheet Import transform map and navigate to the Field Maps related list.
- Set the Coalesce parameter to true for the u_employee_id field to ensure future imports update existing profiles instead of creating redundant rows.
- Test the pipeline using a new spreadsheet containing updates and new entries, then review the Transform History to verify insert and update counts.

7. Phase 8: Create Analytics Reports

- Navigate to Reports under Usage and Governance and create three distinct reports based on the Employee Test table:
 - Report 1: Employees by Department (Pie chart visualization grouped by Department with a Count aggregation).
 - Report 2: Employees by Location (Bar chart visualization grouped by Location with a Count aggregation).
 - Report 3: Employee List Report (List visualization displaying core employee columns).

8. Phase 9: Dashboard Integration & Security

- Adjust access control list (ACL) properties for pa_dashboards by enabling Admin Overrides to allow custom dashboard creation.
- Create a new dashboard named Employee Analytics Dashboard.
- Share and add each of the three created reports (Employees by Department, Employees by Location, and Employee List Report) into the dashboard widgets, configuring sharing roles and groups as required.
